What were your results from `compare_cow_transport_algorithms`? Which algorithm runs faster? Why?

Using `ps1_cow_data.txt` the results were:

```
greedy_cow_transport:
length = 6 trips
time = .000145 seconds
```

```
brute_force_cow_transport:
length = 5 trips
time = 0.48294 seconds
```

The algorithm `greedy_cow_transport` does not iterate through every possible permutation of trips like `brute_force_cow_transport`. In my implementation of `greedy_cow_transport`, first the input dictionary of cows is copied to a list of cow names sorted from largest to smallest weight. The python sorted function utilizes a Timsort which is $\mathcal{O}(n \log n)$. Then `greedy_cow_transport` removes any cow which is larger than `limit`, an $\mathcal{O}(n)$ operation. The sorted list is then utilized to select the cows which can fit on the ship. Starting at the big end of the list, iterate and select cows that can fit onto the ship without exceeding the payload limit. Since the list has been sorted, this is an $\mathcal{O}(n \log n)$ operation. The python sorted function's Timsort and selecting cows operation dominate the run time, making `greedy_cow_transport` $\mathcal{O}(n \log n)$. In comparison, `brute_force_cow_transport` must first create all permutations of the possible trips, $\mathcal{O}(n \log n)$. Then evaluate each of these trips, $\mathcal{O}(n \log n)$.

Does the greedy algorithm return the optimal solution? Why/why not?

The greedy algorithm *does not* return the optimal solution. The nature of this “knapsack” problem can only be solved in $\mathcal{O}(n^2)$. However, a reasonable solution can be solved in much less time. With `ps1_cow_data.txt` the solution is solved on the order of 1/1000 of the time compared to brute force.

3

Does the brute force algorithm return the optimal solution? Why/why not?

Yes, the brute force algorithm does find the optimal solution. All possible solutions are evaluated and the best is chosen. However, this comes at a great cost to run-time speed. With `ps1_cow_data.txt` the solution is solved on the order of 1000 of the time compared to the greedy algorithm.
